ABOUT THIS SESSION

GDPR requires businesses to implement technical and organizational measures to ensure high standards of information security. Art. 32 for instance speaks about the security of data processing. GDPR however cites the principles but not the best practices of implementation.

On the other hand, the ISO 27001 standard for information security provides best-practice requirements for the implementation of an information security management system (ISMS).

This course explores the various requirements under GDPR and you can achieve these through implementing an ISMS within your business. In this manner you will achieve compliance with GDPR.

Some of the topics covered are:

- Overlapping principles in **GDPR and Information Security** such as confidentiality;
- **Risk management** and impact assessments;
- Data subject **consents and rights**.
